LIBRENG REVIEWER · 2026

# Skills Assessment Reviewer: TRA Welder

Documents checklist, practical videos, at **100+ technical interview questions** na may tama at simpleng sagot. Lahat ng sana alam ko na bago ako nag-apply, para hindi mo na maulit ang mga mali ko.

**Kuya Erick Tradie** · Welder, NSW Australia
YouTube: Erick Tradie · ericktradie.github.io

## 👋 1. Bakit ko ginawa ito

Para hindi ka ma-delay katulad ko.

Inabot ng **mga 4 na buwan** ang TRA skills assessment ko bilang welder. Ang pinakamalaking delay? Ako mismo. **Mga 2 buwan** bago ko naipasa lahat ng documents. Kung naipasa ko agad, mas maaga sana natapos ang assessment, at mas maaga sana ang visa.

> **Kuya Erick says:** Hindi mahirap ang skills assessment dahil sa welding. Mahirap ito dahil sa paghahanda. Kapag handa ka, kaya mo 'to.

### 📘 Paano gamitin ang reviewer na ito

1. **Ngayong linggo:** kumpletuhin ang documents (Section 3).
2. **Bago mag-record:** basahin ang Section 4 para hindi mapamahal sa ulit.
3. **Araw-araw, 15 minutes:** sagutin nang **malakas, sa English** ang isang topic sa Section 5. Lagyan ng ✓ ang box kapag tapos na.

## 🗺️ 2. Ang proseso, step by step

Para alam mo kung nasaan ka na.

| # | Stage | Ano ang nangyayari | Sa karanasan ko |
|---|---|---|---|
| 1 | **Documents** | Ipapasa mo ang certificates, proof ng trabaho at ID sa assessment provider. | ~2 buwan (na-delay dahil sa akin) |
| 2 | **Practical** | Ipapakita mo ang pag-weld mo ayon sa instructions ng provider. May provider na video, may provider na sa isang accredited center. | Depende sa provider at occupation |
| 3 | **Technical interview** | Interview sa isang assessor, sa English. Tatanungin ka tungkol sa trabaho mo, safety, at sa ginawa mo sa practical. | Pinaka-nakakakaba |
| 4 | **Result** | Ipapadala ang outcome. Kapag pasado, magagamit mo ito sa visa application. | ~2–3 linggo pagkatapos ng interview |

Iba-iba ang proseso depende sa occupation, bansa at assessment program. Ang official na steps ay nasa tradesrecognitionaustralia.gov.au at sa assessment provider mo. Ang ilang provider ay may written/theory test din.

## 3. Documents checklist: ipasa AGAD

Ihanda lahat **bago** ka magbayad at mag-apply.

- [ ] Passport (bio page) at valid ID
- [ ] TESDA National Certificate (NC II / NC III) at Certificate of Competency, kung meron
- [ ] Certificate of Employment (COE) mula sa bawat employer: buong job title, petsa, full-time o part-time, at mga ginagawa mo bilang welder
- [ ] Payslips para patunayan ang trabaho, mas maganda kung kumpleto bawat taon
- [ ] Employment contract at/o reference letter na naka-letterhead, may pirma at contact details
- [ ] Iba pang proof na hinihingi ng provider mo (halimbawa: tax o government contributions). Basahin ang listahan nila.
- [ ] Updated CV / resume na tugma ang petsa sa COE
- [ ] Malinaw na scan (color, PDF), tamang file name, at English translation kung kailangan

**Tropa tip:** Dapat pare-pareho ang job title, petsa at duties sa COE, payslip at CV. Ang hindi tugma ang madalas pagtanungan ng assessor.

## 4. Practical: paano hindi mapamahal

Isang beses lang dapat. Ang ulit ay gastos.

- **Huwag mag-DIY.** Pumunta sa isang **accredited center** na kumpleto ang tools, equipment at consumables. Mas mura ito kaysa bumili ka ng sarili mong gamit.
- Basahin nang buo ang instructions ng provider: aling process (MMAW/SMAW, GMAW, at iba pa), aling positions, ilang test pieces, at ang tamang angle ng camera.
- Mag-practice muna nang ilang beses **bago** ang actual.
- Ipakita ang buong proseso: PPE, paghahanda ng material, machine settings, ang weld, cleaning at visual inspection.
- Malinaw na ilaw at stable na camera. Kapag hindi makita ng assessor, parang hindi mo ginawa.
- **Tandaan ang ginawa mo:** amps, electrode o wire, gas at flow. Tatanungin ka tungkol dito sa interview.

# 5. Technical interview: 100+ practice questions

Sa English. Simple at totoo. Base sa sarili mong trabaho.

Practice questions ito para masanay ka. **Hindi** ito ang eksaktong mga tanong. Ang mga sagot ay halimbawa lang: **palitan mo ng sarili mong tools, trabaho at kwento.** Mas pinaniniwalaan ng assessor ang totoong karanasan kaysa kabisadong sagot.

## 🧩 Paano sumagot: 3 parts lang

**1. WHAT**
Ano ang gamit o ginagawa ko

**2. HOW**
Paano ko ito ginagawa, step by step

**3. WHY**
Bakit: para sa safety o quality

**Tanong:** What power tools do you use?
✗ **Mahina:** "Grinder."
✓ **Malakas:** "I use an angle grinder *(what)*. Before I use it, I check the guard, the disc and the cable, and I wear a face shield and gloves *(how)*, because the disc can break and sparks can hurt my eyes *(why)*."

## ⚠️ Mga maling sagot na kumakalat (iwasan!)

Madalas makita ang mga sagot na ito sa mga lumang reviewer na pinapasa-pasa. Mali o delikado sila. Ang mga tanong na may **INAYOS** sa ibaba ay naitama na.

| Tanong | ✗ Maling sagot | ✓ Tamang sagot |
|---|---|---|
| Napaso ang kamay ng kasama mo | Hugasan at lagyan ng burn cream | Palamigin sa running water nang **20 minutes**. Walang cream, walang yelo. Takpan, kumuha ng first aid, i-report. |
| Oxy-acetylene pressure | 40 PSI oxygen, 10 PSI acetylene "kahit anong tip size" | Depende sa **tip size at kapal** ng bakal. Sundin ang chart ng manufacturer. Acetylene: **hindi lalampas sa 100 kPa** (mga 15 psi). |
| GMAW gas flow | 10–15 PSI | Ang flow ay sinusukat sa **L/min**, mga 10–20 L/min. Sundin ang WPS. |
| Tungsten colours | Red = carbon steel, White = stainless | DC (steel, stainless): red, gold, blue o grey. AC (aluminium): green o white. |
| Sino ang responsable sa safety? | "Worker" | **Lahat:** ang employer (PCBU) at bawat worker. |
| Saan makikita ang SOP? | "Search sa Google" | Sa machine o manual, sa SOP folder ng kumpanya, o tanungin ang supervisor. |
| Paano malalaman ang panganib ng chemical? | "Material Safety Data Sheet" | Sa Australia: **Safety Data Sheet (SDS)** at ang label. |

## 🦺 A. Safety (WHS) at PPE

☐ Na-practice ko

**1 What PPE do you wear when welding, and why?**

**Sagot:** A welding helmet with the correct shade to protect my eyes and face from the arc. Safety glasses under the helmet for chipping slag. Leather gloves, a leather jacket or fire-resistant clothes, and safety boots to protect me from heat and sparks. Ear plugs when it is noisy, and a respirator when there are a lot of fumes.

**2 What are the main hazards in welding and fabrication?**

**Sagot:** Arc flash (arc eye), burns, fire, welding fumes, electric shock, noise, flying sparks and metal from grinding, heavy lifting, and gas cylinders.

**3 Who is responsible for health and safety at work?** INAYOS

**Sagot:** Everyone. The employer (PCBU) must give a safe workplace, training and PPE. Every worker must follow the rules, use PPE, look after others, and report hazards.

**4 How do you make the area safe before you weld?**

**Sagot:** I remove anything that can burn, or cover it with a fire blanket. I put up welding screens to protect other people. I check ventilation, cables and the earth clamp, and I make sure a fire extinguisher is close. If needed, I get a hot work permit.

**5 What is a hot work permit?**

**Sagot:** A written approval to weld or cut in a place with fire risk. It lists the controls, like removing flammables and having a fire watch during and after the work.

**6 What PPE do you wear when using a disc grinder?**

**Sagot:** Safety glasses and a face shield, ear muffs or plugs, leather gloves, long sleeves, safety boots, and a dust mask. No loose clothes.

**7 What PPE do you wear for oxy-acetylene cutting?**

**Sagot:** Gas cutting goggles or a face shield with the correct shade, leather gloves, a leather jacket or apron, and safety boots.

**8 What is the emergency evacuation procedure? When is it needed?**

**Sagot:** It is needed for a fire, gas leak, big chemical spill or when the alarm sounds. I stop work, turn off my machine and gas if it is safe, walk calmly to the nearest exit, and go to the assembly area. I follow the warden and wait there until we are told it is safe.

**9 A workmate burns his hand while welding. What first aid do you give?** INAYOS

**Sagot:** I cool the burn under cool running water for 20 minutes. I take off rings or a watch if they are not stuck. No ice, no butter, no cream. I cover it loosely with a clean non-stick dressing or cling wrap, call the first aider, and get medical help if it is serious. Then I report it.

## 💪 B. Manual handling

☐ Na-practice ko

**10 What is the correct way to lift something heavy?**

**Sagot:** Bend my knees, keep my back straight, hold the load close to my body, and lift with my legs. I don't twist. I turn with my feet.

**11 How do you decide if a part is too heavy to lift by hand?**

**Sagot:** I check the weight, size and shape, and how far I need to carry it. If it is too heavy or awkward, I ask for a team lift or use a trolley, hoist or crane with a trained operator.

## C. Environment

☐ Na-practice ko

**12 How do you reduce and recycle waste at work?**

**Sagot:** I reuse offcuts when I can. I put scrap steel in the scrap metal bin for recycling. I put electrode stubs, worn parts and rubbish in the right bins, and I follow the site waste rules.

**13 Where do you put scrap metal?**

**Sagot:** In the marked scrap metal bin, so it can be recycled and nobody trips on it.

**14 How can you save power and water in the workshop?**

**Sagot:** Turn off machines, compressors and lights when not in use. Report or fix leaks of water, air or gas.

**15 What do you do if there is an oil spill or environmental incident?** INAYOS

**Sagot:** I make it safe first: stop the leak if it is safe, and keep sparks and flames away. I use the spill kit or absorbent to contain it and stop it reaching the drains. I clean up and throw it away the right way (check the SDS), then report and record it.

## D. Communication at planning

☐ Na-practice ko

**16 At the start of the day, how do you find out what jobs to do?**

**Sagot:** At the toolbox talk or pre-start meeting with my supervisor, and from the job card or work order and the drawings.

**17 If you don't understand a task, what do you do?**

**Sagot:** I ask my supervisor to explain again and I check the drawing or WPS. I never guess.

**18 Where can you find the job requirements?**

**Sagot:** On the job card or work order, the drawings, the WPS, the SOPs, and from my supervisor.

**19 What information is on a job card?**

**Sagot:** The job number, the task, the drawing number, materials, quantity, due date, and a place to sign when it is done.

**20 How do you plan the order of a job?**

**Sagot:** I read the job card and drawing, get the materials, tools and PPE, and check for hazards. Then I follow the steps: mark out, cut, fit up, tack, weld, clean and inspect.

**21 How do you check your finished work meets the specification?**

**Sagot:** I measure it against the drawing (sizes and squareness), check the welds for size and defects, fill in the QA checklist, and ask my supervisor to sign it off.

**22 If you were monitoring a process, what charts would you use?**

**Sagot:** Simple charts like a check sheet, a bar chart, or a line (run) chart that shows measurements over time. They help me see quickly if the work is going out of spec.

## 🤝 E. Teamwork at training

☐ Na-practice ko

**23 What task have you done with a team?**

**Sagutin gamit ang sarili mo:** Give a real job. Example: "We fabricated and installed a steel frame. We lifted and fitted heavy beams together."

**24 What was your job in that team?**

**Sagutin gamit ang sarili mo:** Say your part. Example: "I did the fit-up and welding, and I guided the lift so everyone was safe."

**25 What is important when working in a team?**

**Sagot:** Clear communication, knowing who does what, looking out for each other's safety, and helping each other. It makes the job safer, faster and easier.

**26 How would you train a workmate in a new skill?**

**Sagot:** I explain the SOP and safety first. I show them how to do it. Then they try while I watch, I give feedback, and I check they understand.

**27 What skills have you trained others in?**

**Sagutin gamit ang sarili mo:** Example: "I trained new workers in GMAW (MIG) welding and in using the grinder safely."

**28 Where is training recorded?**

**Sagot:** In the training records, kept by my supervisor or the HR department.

## 💻 F. Computers at records

☐ Na-practice ko

**29 What computer technology have you used at work?**

**Sagot:** Email, Word and Excel for timesheets and reports, and my phone to take photos of finished work.

**30 How do you store and find data at work?**

**Sagot:** In labelled folders on the shared drive or email, with a username and password. That way it is safe and easy to find.

**31 What do you do if a computer is not working?**

**Sagot:** I report it to my supervisor or the IT person. I don't try to fix it if I'm not trained.

## ✅ G. Quality

☐ Na-practice ko

**32 Why does a company need a quality system?**

**Sagot:** So everyone works the same correct way, the product meets the drawing and the standard, there are fewer mistakes and less rework, and there are records of what was done.

**33 What is the purpose of an SOP (Standard Operating Procedure)?**

**Sagot:** It gives the safe and correct steps for a task, so the job is done the same way and to the same standard every time.

**34 How do you make sure your work is good quality?**

**Sagot:** I follow the drawing and the WPS, measure before I cut, check the fit-up before welding, inspect my welds, and record my checks.

**35 What tools do you use to check quality?** INAYOS

**Sagot:** A tape measure, steel rule, square, vernier caliper, protractor, and a weld (fillet) gauge. For important welds, NDT tests.

**36 Why do we keep test records?**

**Sagot:** To prove the work was checked and passed, to trace a problem later, and to improve the quality system.

**37 How do you report a deviation (something not to spec)?** INAYOS

**Sagot:** I stop, measure again to be sure, tag the part, tell my supervisor or QA, and record it on a non-conformance report. I never hide it.

## 🔧 H. Hand tools at power tools

☐ Na-practice ko

**38 What hand tools do you use often?**

**Sagot:** Chipping hammer, wire brush, files, hammer, scriber, centre punch, square, tape measure, clamps, spanners and pliers.

**39 How do you look after your tools?**

**Sagot:** I clean them after use, check for damage, tag and remove broken tools, and keep them in their storage place.

**40 What power tools do you use?**

**Sagutin gamit ang sarili mo:** Example: "Angle grinder, drill and magnetic drill." Use the 3-part formula: what, how, why.

**41 What safety checks do you do before using a disc grinder?**

**Sagot:** The guard is on and tight, the handle is fitted, the disc is the right type and speed rating with no cracks, the cable and plug are not damaged (test tag in date), and the switch works.

**42 If a grinder is not safe, how do you let others know?**

**Sagot:** I put an "Out of service / Danger" tag on it, take it out of use, and tell my supervisor.

**43 How do you maintain and store a grinder?**

**Sagot:** Unplug it, clean the dust from the guard and vents, check the disc and cable, roll the cable neatly, and store it in its place.

## ⚙️ I. Workshop machines

☐ Na-practice ko

**44 What workshop machines have you used?**

**Sagutin gamit ang sarili mo:** Example: "Drill press, bandsaw, guillotine (shear), press brake and bench grinder." Only say machines you really used.

**45 What did you use the cutting machines for?**

**Sagot:** Example: "The guillotine to cut steel sheet and plate, and the bandsaw to cut pipe, angle and flat bar to length."

**46 What pre-start checks do you do before using a machine?**

**Sagot:** Guards are in place, the emergency stop works, cables and switches are OK, there are no oil or air leaks, the blade or tool is sharp, and the area is clean and clear. I fill in the pre-start checklist.

**47 What safety precautions do you take when using machines?**

**Sagot:** I follow the SOP, use machines only if I'm trained, wear PPE, keep guards on, keep my hands clear, and never leave a machine running.

**48 How do you hold material when drilling?**

**Sagot:** I clamp it in a drill vice or with clamps. Never hold it by hand.

**49 How do you sharpen or change a cutting tool?**

**Sagot:** I switch off and isolate the machine first. I wear PPE, change or sharpen the tool following the manual, check it is tight, then do a test run.

**50 What regular checks do you do on machines, and where do you record them?**

**Sagot:** Guards, emergency stop, blades, oil level and leaks. I record them in the machine logbook or pre-start checklist.

**51 How do you shut down a machine for maintenance?**

**Sagot:** Stop the machine, switch off and lock out the power at the isolator, put on my danger tag, and test that it cannot start.

**52 Who can remove a danger tag?**

**Sagot:** Only the person who put it on, or an authorised person following the site procedure.

**53 Where do you find the SOP for a machine?** INAYOS

**Sagot:** Near the machine, in the manufacturer's manual, in the company SOP folder, or I ask my supervisor.

## 🧪 J. Chemicals

☐ Na-practice ko

**54 What chemicals do you use at work?**

**Sagot:** Paint, thinners, degreaser, anti-spatter spray and dye penetrant.

**55 How do you find out the dangers of a chemical?** INAYOS

**Sagot:** I read the Safety Data Sheet (SDS) and the label on the container.

**56 What PPE do you wear when handling chemicals?**

**Sagot:** What the SDS says. Usually chemical-resistant gloves, safety glasses or goggles, an apron, boots, and a respirator if there are fumes.

**57 If you get a chemical burn, what do you do?** INAYOS

**Sagot:** Wash it with lots of running water for at least 20 minutes and take off any clothes with the chemical on them. Check the SDS for first aid, get medical help, then report it to the supervisor or safety officer and fill in an incident report.

## 📐 K. Drawings at marking out

☐ Na-practice ko

**58 What information is on a drawing?**

**Sagot:** The views, sizes (dimensions) and tolerances, material, weld symbols, quantity, and notes.

**59 What tools do you use to mark out a job?**

**Sagot:** Scriber, square, steel rule, tape measure, centre punch, soapstone, and dividers.

**60 What is the starting point for marking out called? Why is it important?**

**Sagot:** The datum or reference line. I measure everything from the same point so the sizes are exact and small errors don't add up.

**61 After marking out, what do you check before cutting?**

**Sagot:** I measure again against the drawing and check that it is square (measure the diagonals). Measure twice, cut once.

**62 How do you read a weld symbol?**

**Sagot:** The shape shows the type of weld (a triangle is a fillet weld). On most drawings, the symbol under the line means weld on the arrow side, and above the line means the other side. A flag means weld on site. A circle means weld all around. Letters or notes give the process and finish (for example, ground flush).

**63 How would you make a small job from a drawing (for example a dust pan)?**

**Sagot:** Read the drawing, get the material, mark out, cut, fold or bend, fit and tack, then weld or join. Clean it and check it against the drawing.

**64 How do you join the parts?**

**Sagot:** The way the drawing says: usually tack welds first, then full welds. Sometimes plug welds, rivets or screws.

**65 What do you use when assembling many of the same parts? When?**

**Sagot:** A jig or fixture, with clamps. I use it when making many parts that are the same, so every part is in the right position, faster and the same every time.

## 🔥 L. Welding process

☐ Na-practice ko

**66 How do you prepare material before welding?**

**Sagot:** I clean off rust, paint, oil and mill scale near the joint, cut or bevel the edge if needed, and check the gap and fit-up.

**67 How do you line up material to be welded?**

**Sagot:** With a square and clamps, then tack welds. I check the sizes and squareness again before the full weld.

**68 What is a WPS and what is in it?**

**Sagot:** A Welding Procedure Specification. It tells you the process, base metal, electrode or wire, joint preparation, position, amps and volts, gas and flow, preheat, run order, and the standard (for structural steel in Australia, AS/NZS 1554.1). Following it makes the weld meet the standard.

**69 Which process would you use for carbon steel, stainless steel and aluminium?**

**Sagot:** Carbon steel: MMAW, GMAW, FCAW or GTAW. Stainless steel: GTAW, GMAW, or MMAW with stainless electrodes. Aluminium: GTAW on AC, or GMAW with aluminium wire and pure argon.

**70 How do you choose the amperage?**

**Sagot:** From the electrode or wire size, the metal thickness, the position, and the WPS or the electrode box. Then I fine-tune with a test run.

**71 How do amps and volts affect the weld?** INAYOS

**Sagot:** More amps = more heat and deeper penetration. Too many amps can cause undercut, burn-through and spatter. Too few cause poor fusion. Volts (arc length) control how wide and flat the bead is. Too many volts cause spatter and porosity.

**72 Name 2 ways to reduce distortion.** INAYOS

**Sagot:** Use even tack welds, clamps or a jig. Weld in a balanced or back-step order. Don't put in more heat than needed (right weld size, let it cool between runs).

**73 Why do some steels need preheat?**

**Sagot:** Preheat dries out moisture and slows the cooling. This stops hydrogen cracking, especially in thick steel or high-carbon steel. The WPS says when and how hot.

## M. MMAW / SMAW (stick)

☐ Na-practice ko

**74 How do you set up an MMAW machine?**

**Sagot:** I check the machine and cables for damage. I connect the electrode holder and work lead to the polarity the electrode needs (for E7018 and E6011, usually DCEP: holder to positive). I put the earth clamp on clean metal near the weld, set the amps for the electrode size, and put on my PPE and screens.

**75 What 2 types of electrodes have you used?**

**Sagot:** E6011 (cellulose): deep penetration, good for root runs and dirty metal. E7018 (low hydrogen): strong, low risk of cracking, used for structural work.

**76 How do you store low-hydrogen electrodes?**

**Sagot:** Keep them dry, in a rod oven, as the manufacturer says. Moisture can cause cracking.

**77 What weld defects can happen in MMAW?**

**Sagot:** Undercut, overlap, slag inclusion, porosity, lack of fusion or penetration, cracks, too much spatter, and arc strikes.

**78 Name common weld defects and their causes.**

**Sagot:** Porosity (dirty metal or poor gas cover), undercut (too many amps or wrong angle), lack of fusion (too little heat or too fast), slag inclusion (slag not cleaned between runs), cracks (moisture, fast cooling).

## N. GMAW (MIG)

☐ Na-practice ko

**79 When would you use GMAW?**

**Sagot:** For production work and long welds on thin to medium steel. It is fast and clean, with no slag.

**80 Explain the difference between MMAW (SMAW) and GMAW.**

**Sagot:** MMAW uses a flux-coated stick electrode. GMAW uses a wire fed through the gun with a shielding gas.

**81 What shielding gas do you use?**

**Sagot:** Carbon steel: argon and $CO_2$ mix (or 100% $CO_2$). Stainless steel: an argon mix made for stainless. Aluminium: 100% argon.

**82 What is the gas flow rate for GMAW?** INAYOS

**Sagot:** Flow is measured in litres per minute on the flowmeter, usually about 10–20 L/min. I follow the WPS and block the wind if I'm outside.

**83 Why must the nozzle and contact tip be clean?**

**Sagot:** Spatter in the nozzle blocks the gas and causes porosity. A worn or dirty tip makes the arc unstable and the wire feed bad. I clean them and use anti-spatter.

## O. FCAW (flux-cored)

☐ Na-practice ko

**84 How do you set up an FCAW unit?**

**Sagot:** A constant-voltage machine, wire feeder with the right drive rolls, flux-cored wire, gun, work lead (earth clamp), and gas if the wire needs it. I set the polarity the wire box says.

**85 What shielding gas do you use for FCAW?** INAYOS

**Sagot:** Gas-shielded wire: 100% $CO_2$ or an argon/$CO_2$ mix, as the wire maker says. Self-shielded wire: no gas.

**86 What affects weld quality in flux-cored welding?** INAYOS

**Sagot:** Wrong volts or wire speed, wrong stick-out, poor gas cover or wind, dirty metal, wrong polarity, and not cleaning slag between runs.

## 🎯 P. GTAW (TIG)

☐ Na-practice ko

**87 What equipment do you need to set up GTAW?**

**Sagot:** TIG machine, torch, tungsten, collet and cup, argon cylinder with regulator and flowmeter, foot pedal or switch, work lead, and filler rods.

**88 What materials can you weld with GTAW?** INAYOS

**Sagot:** Carbon steel, stainless steel, aluminium, and copper. It is best for thin metal and clean, high-quality welds.

**89 What tungsten (colour) do you use?** INAYOS

**Sagot:** For DC (steel and stainless): red (thoriated), gold or blue (lanthanated), or grey (ceriated). For AC (aluminium): green (pure) or white (zirconiated). Colours follow the box, so I always check the label.

**90 What current do you use for low carbon steel and stainless?**

**Sagot:** DCEN (Direct Current Electrode Negative).

**91 What current do you use for aluminium?** INAYOS

**Sagot:** AC (Alternating Current). It cleans the oxide on the aluminium. AC has no positive or negative side. I use pure argon.

## 🔥 Q. Oxy-acetylene cutting

☐ Na-practice ko

**92 How do you set up oxy-acetylene equipment for cutting?** INAYOS

**Sagot:** Cylinders upright and chained. Check there is no oil or grease on fittings. Fit the regulators (oxygen is right-hand thread, acetylene is left-hand), flashback arrestors, hoses and the cutting torch. Leak test with soapy water, set the pressures from the chart, and purge the hoses before lighting.

**93 What gas pressures do you use?** INAYOS

**Sagot:** It depends on the tip size and the thickness of the steel, so I follow the manufacturer's chart. Acetylene must never go above 100 kPa (about 15 psi).

**94 Which gas does the cutting?**

**Sagot:** Oxygen. The flame heats the steel, then the cutting oxygen burns it away. It works on carbon steel, not on stainless steel or aluminium.

**95 What flame do you use for cutting?**

**Sagot:** A neutral flame for the preheat.

**96 What causes bad oxy-acetylene cuts?** INAYOS

**Sagot:** Wrong pressure or wrong tip size, travel speed too fast or too slow, wrong torch angle or height, and a dirty tip. You see a rough edge, a melted top edge, or slag stuck under the cut.

## 🔍 R. Weld inspection at repairs

☐ Na-practice ko

**97** **What do you look for when you inspect a weld?**

**Sagot:** Size and length as per the drawing, a good shape (profile), and defects: porosity, slag, undercut, overlap, cracks, lack of fusion or penetration, and spatter. I use a weld gauge.

**98** **Name 3 non-destructive tests (NDT) for welds.**

**Sagot:** Visual inspection, dye penetrant test, and magnetic particle test. Others: ultrasonic test and X-ray (radiography).

**99** **How do you clean and check a weld after welding?**

**Sagot:** Chip off the slag, wire brush it (a stainless brush for stainless), remove spatter, then check it visually.

**100** **How do you repair a faulty weld?** INAYOS

**Sagot:** Find and mark the defect. Remove it by grinding or gouging down to good metal. Prepare the joint again, re-weld following the WPS, inspect it again, and record the repair.

**101** **A crane damaged a section of safety rail. How would you repair it?**

**Sagot:** Make the area safe and barricade it. Get a hot work permit if needed. Measure and sketch the damaged part, fabricate a new section, cut out the damaged part, fit and weld the new one, grind and paint it, inspect it, then remove the barricade and record the job.

## 🙋 S. Tungkol sa trabaho at practical mo

☐ Na-practice ko

**102** **Describe a normal working day in your last job.**

**Sagutin gamit ang sarili mo:** What you make, which materials and processes, and who checks your work. Example: "I start with the toolbox talk, then I read the drawing and fabricate frames using GMAW..."

**103** **Which positions can you weld? Which is hardest, and how do you handle it?**

**Sagutin gamit ang sarili mo:** Be honest: flat, horizontal, vertical, overhead. Explain your technique for the hardest one (angle, amps, speed).

**104** **In your practical, why did you use those settings?**

**Sagutin gamit ang sarili mo:** Know your amps, electrode or wire, gas and flow, and why you chose them (thickness, position, WPS).

**105** **Tell me about a problem at work and how you fixed it.**

**Sagutin gamit ang sarili mo:** A short real story: the problem → what you did → the result.

**Kuya Erick says:** Kung hindi mo naintindihan ang tanong, okay lang magsabi ng **"Sorry, can you repeat the question please?"** Mas maganda 'yan kaysa sumagot nang mali. At sagutin mo gamit ang sarili mong trabaho, hindi kabisadong sagot.

## 6. Mga pagkakamaling iwasan

Galing sa sarili kong karanasan.

1. **Pagpapatagal sa documents.** Ito ang nagpa-delay sa akin ng ~2 buwan. Kumpletuhin muna bago mag-apply.
2. **DIY na practical** na kulang ang gamit. Mapapamahal ka lang sa ulit.
3. **Hindi tugmang details** sa COE, payslip at CV.
4. **Kabisadong one-word answers** sa interview. Gamitin ang What → How → Why.
5. **Paniniwala sa maling reviewer.** I-check ang safety answers (burns, gas pressure, PPE). Ang mali dito ay puwedeng ikabagsak mo.
6. **Pagkalimot sa ginawa mo sa practical.** Isulat ang settings mo at basahin bago ang interview.

## 7. Ang next step mo

Gawin ngayong linggo.

- [ ] Hanapin ang occupation mo sa tradesrecognitionaustralia.gov.au
- [ ] Kumpletuhin ang documents checklist (Section 3)
- [ ] Maghanap ng accredited center para sa practical
- [ ] Isang topic kada araw sa Section 5: sagutin nang malakas, sa English, at lagyan ng ✓
- [ ] Mag-practice kasama ang kaibigan: siya ang assessor, ikaw ang sasagot

### Panoorin ang skills assessment videos ko

Sa YouTube: **Erick Tradie**. May tanong ka? I-comment mo sa video at baka sagutin ko sa susunod na episode.
Iba pang libreng reviewer (PTE, TESDA to Australia): **ericktradie.github.io**

---

Gabay lang ito batay sa sariling karanasan ni Erick Tradie bilang welder sa NSW at sa mga karaniwang practice question. Hindi ito ang eksaktong mga tanong ng assessment. Hindi ito legal, migration, safety o medical advice, at hindi kami affiliated sa Trades Recognition Australia (TRA), sa assessment providers, o sa Australian Government. Sa trabaho, laging sundin ang WPS, SDS, manufacturer instructions at site procedures. Nagbabago ang requirements, kaya i-verify palagi sa official na website at sa assessment provider mo. Para sa visa advice, kumonsulta sa registered migration agent (MARN). Checked: November 2026.
